## Module Documentation

### 3.1 LCD KPD Module Header.

#### Functions

- int [lk\\_open](#) (void)  
*This API Function is used to open LCD and Keypad devices. Note: This function must be called before any LCD and Keypad functions.*
- void [lk\\_dispcclr](#) (void)  
*This API Function clears all pixels on LCD. Note: This function must be called explicitly after lk\_open to clear LCD.*
- void [lk\\_dispfill](#) (void)  
*This API Function fills all pixels on LCD.*
- int [lk\\_displineclr](#) (unsigned char line\_no)  
*This API Function Clears pixels of the Specified line on LCD.*
- int [lk\\_disptext](#) (unsigned char line\_no, unsigned char column, unsigned char \*data, unsigned char font)  
*This API Function displays the string of data at specified line and column in a given font.*
- void [lk\\_close](#) ()  
*This API Function is used to close device.*
- int [lk\\_dispbmp](#) (unsigned char xstartcord, unsigned char ystartcord, unsigned char xendcord, unsigned char yendcord, unsigned char \*bmp)  
*This API Function displays the BMP Image on LCD at user given coordinates. Windows tool provided to convert bmp to hex.*
- int [lk\\_dispbox](#) (unsigned char line\_no, unsigned char cmdnd)  
*This API Function Displays Box at Specified Line.*
- int [lk\\_getalpha](#) (unsigned char line\_no, unsigned char start\_pos, unsigned char \*data, unsigned char max\_cnt, unsigned char count, unsigned char keytype)

*This API function is used to pass a buffer with a Null string or a non-null string and the subsequent alpha numeric characters are filled from keypad entry by user. Entire String is displayed in LCD. Alpha Key is pressed to toggle among numeric and various alphabets for a single key.*

- int [lk\\_getnumeric](#) (unsigned char line\_no, unsigned char start\_pos, unsigned char \*data, unsigned char max\_cnt, unsigned char count)

*This API function is used to pass a buffer with a Null string or a non-null string and the subsequent Numeric characters are filled from keypad entry by user. Entire String is displayed in LCD.*

- int [lk\\_getpassword](#) (unsigned char \*ptr, unsigned char line\_no, unsigned char max\_cnt)

*This API Function is used to get the password from the keypad. Digits entered will be displayed as '\*' on the display and fills the target buffer with entered digits.*

- int [lk\\_getamount](#) (unsigned char line\_no, unsigned char start\_pos, unsigned char \*ptr, unsigned char max\_digits, unsigned char decimal\_pos)

*This API function is used to get amount from user.*

- int [lk\\_dispbbutton](#) (unsigned char \*button1, unsigned char \*button2, unsigned char \*button3, unsigned char \*button4)

*This API Function Display the Four Buttons at 5th line of LCD.*

- int [lk\\_disphlight](#) (unsigned char line\_no)

*This API function is used to highlight a given row of text on LCD.*

- int [lk\\_dispfont](#) (unsigned char \*user\_font, unsigned char font\_width)

*This API Function which type of Font to be Displayed on LCD.*

- int [lk\\_bkl\\_timeout](#) (int bkltime)

*This API function sets statically LCD backlight timeout. The default timeout is 4 sec. If you want the change the backlight timeout permanently you have to call this function once in your application.*

- int [lk\\_dispbklight](#) (int val)

*This API function shows lcd backlight intensity.*

- int [lk\\_dispkpbklight](#) (int val) int [lk\\_lcdintensity](#)(unsigned char value)

*This API function shows keypad backlight intensity.*

- int [lk\\_gsm\\_signal](#) (unsigned long gsm\_signal)

*This function is to display signal strength of GSM modem which is connected to ttyMXC0. By giving 'at+csq' command to modem, we can get the GSM signal strength. By giving the GSM signal strength value to this function we can update the signal strength bars on top of the LCD.*

- unsigned char [lk\\_getkey](#) (void)

*This API Function is used to get key that is pressed. It will wait until key is pressed and returns the key value.*

- unsigned char [lk\\_getkey\\_wait](#) (void)

*This function returns key pressed at that particular instant, if there is no key event returns 0xff. This function is similar to lk\_getkey, only difference is it returns 0xff if there is no key pressed and it won't wait for a key.*

- int [lk\\_buzzer\\_time](#) ()

*This API Function gives buzzer Beep delay of 20ms time.*

- int `lk_buzzer` (int count)  
*This API Function gives buzzer Beep count time.*
- int `lk_underline` (unsigned char line\_no, unsigned char col, unsigned char length, unsigned char font\_width)  
*This API Function underlines the text On LCD.*
- int `lk_getpinpadid` (char \*machineid)  
*This API function is used to get the PIN PAD ID. (Pre Requirements: This id should be set at u-boot prompt before call this API like below VISIONTEK # setenv machineid 1234567890 VISIONTEK # saveenv).*
- int `lk_gethwid` (char \*hwid)  
*This API function is used to get the Hardware ID. (Pre Requirements: This id should be set at u-boot prompt before call this API like below VISIONTEK # setenv hwid 87654321 VISIONTEK # saveenv).*

### 3.1.1 Function Documentation

#### 3.1.1.1 int `lk_bkl_timeout` ( int *bkltime* )

This API function sets statically LCD backlight timeout. The default timeout is 4 sec. If you want the change the backlight timeout permanently you have to call this function once in your application.

##### Parameters

***bkltime*** Description: back light timeout in seconds and the range is 4 sec to 30 sec. Type: Input  
Range: 4 - 30

##### Returns

0 on Success. -1 on Failure. -2 on Argument errors.

#### 3.1.1.2 int `lk_buzzer` ( int *count* )

This API Function gives buzzer Beep count time.

##### Parameters

***count*** Description: Time count to get buzzer Type: Input Range: 0 - 10

##### Returns

0 on Success. -1 on Failure. Limits are like below if count  $\leq 0$  it will give one beep. if count  $> 10$  it gives maximum of 10 Beeps

#### 3.1.1.3 int `lk_buzzer_time` ( )

This API Function gives buzzer Beep delay of 20ms time.

##### Returns

0 on Success. -1 on Failure.

#### 3.1.1.4 void lk\_close ( )

This API Function is used to close device.

##### Returns

: None.

#### 3.1.1.5 int lk\_dispbklight ( int *val* )

This API function shows lcd backlight intensity.

##### Parameters

*value* value (0-3) default value is 3.

##### Returns

0 on Success. -1 on Failure.

#### 3.1.1.6 int lk\_dispbmp ( unsigned char *xstartcord*, unsigned char *ystartcord*, unsigned char *xendcord*, unsigned char *yendcord*, unsigned char \* *bmp* )

This API Function displays the BMP Image on LCD at user given coordinates. Windows tool provided to convert bmp to hex.

##### Parameters

*xstartcord* Description: Start of x co-ordinate Type: Input Range: 0 - 127

*xendcord* Description: end of x co-ordinate Type: Input Range: upto 127

*ystartcord* Description: Start of y co-ordinate Type: Input Range: 0 - 63

*yendcord* Description: end of y co-ordinate Type: Input Range: upto 63

*bmp* Description: Displays BMP hex data Type: Input Range: (y) 64 x 128 (x)

##### Returns

0 on SUCCESS. -1 on Error. -2 if there is arguments error.

#### 3.1.1.7 int lk\_dispbox ( unsigned char *line\_no*, unsigned char *cmd* )

This API Function Displays Box at Specified Line.

##### Parameters

*line\_no* Description: line number to display the box on the LCD. Type: Input Range: 0 - 5

*cmd* Description: cmd should be 0x00 or 0x01. Type: Input Range: 0 - 1 '0' for box '1' for no box  
Note: display text in the box after drawing box (i.e. don't draw box after write text)

##### Returns

0 on Success. -1 on Error. -2 if There is arguments error.

**3.1.1.8 int lk\_dispbbutton ( unsigned char \* *button1*, unsigned char \* *button2*, unsigned char \* *button3*, unsigned char \* *button4* )**

This API Function Display the Four Buttons at 5th line of LCD.

**Parameters**

*button1,button2,button3,button4* Description: Buffers to display 4 characters of each button Type:  
Input Range: 4 characers only including space character

**Returns**

0 on Success. -1 on Error.

**3.1.1.9 void lk\_dispcclr ( void )**

This API Function clears all pixels on LCD. Note: This function must be called explicitly after lk\_open to clear LCD.

**Returns**

0 on Success. -1 on Failure.

**3.1.1.10 void lk\_dispfill ( void )**

This API Function fills all pixels on LCD.

**Returns**

None.

**3.1.1.11 int lk\_dispfont ( unsigned char \* *user\_font*, unsigned char *font\_width* )**

This API Function which type of Font to be Displayed on LCD.

**Parameters**

*\*user\_font* Description: which font table to be displayed of 6x8 character size. Type: Input Range:  
255 characters font table

*font\_width* Description: width of the given Font. Type: Input Range: 6

**Returns**

0 on Success -1 on Error Note: This function should call immediately after [lk\\_open\(\)](#)

**3.1.1.12 int lk\_disphlight ( unsigned char *line\_no* )**

This API function is used to highlight a given row of text on LCD.

**Parameters**

*line\_no* Description: line number to display the text on the LCD. Type: Input Range: 0 - 5

**Returns**

0 on Success. -1 on Failure. -2 on Argument Errors.

**3.1.1.13 int lk\_dispkbklight ( int val )**

This API function shows keypad backlight intensity.

**Parameters**

*value* value (0-3) default value is 3.

**Returns**

0 on Success. -1 on Failure. This API shows LCD Intensity.

**Parameters**

*value* Description: (0-63) Default value is 24. Type: Input Range: 0 - 63

**Returns**

: 0 on Success. -1 on Failure. -2 on Argument Errors.

**3.1.1.14 int lk\_displineclr ( unsigned char line\_no )**

This API Function Clears pixels of the Specified line on LCD.

**Parameters**

*line\_no* Description: line number to clears the LCD. Type: Input Range: 0 - 5

**Returns**

0 on Success. -1 on Error. -2 if there is argument error.

**3.1.1.15 int lk\_disptext ( unsigned char line\_no, unsigned char column, unsigned char \* data, unsigned char font )**

This API Function displays the string of data at specified line and column in a given font.

**Parameters**

*line\_no* Description: line number to display the txt on the LCD. Type: Input Range: Depends on font  
0-5 - font 0; 0-4 - font 1; 0-5 - font 2; 0-4 - font 3;

*column* Description: column number to Display the txt. Type: Input Range: 0 - 20 - Font 0 Font1; 0 - 10 - Font 2; 0 - 18 - Font 3

*data* Description: Buffer to display text data on LCD. Type: Input Range: Data Length range minimum is 1 character and maximum 124 characters,

**font** Description: type of font. Type: Input Range: 0 - 3 '0' 6x8 then each line displays 21 characters and lines range is 0-5 '1' 6x16 then each line displays 21 characters and possible 4 lines (because height is doubled) '2' 12x8 then each line displays 10 characters and lines range is 0-5 (because width is doubled) '3' 12x16 then each line displays 10 characters and possible 4 lines (both doubled)

### Returns

Number of characters Displayed on LCD -1 on Failure. -2 if there is arguments error.

#### 3.1.1.16 int lk\_getalpha ( unsigned char line\_no, unsigned char start\_pos, unsigned char \* data, unsigned char max\_cnt, unsigned char count, unsigned char keytype )

This API function is used to pass a buffer with a Null string or a non-null string and the subsequent alpha numeric characters are filled from keypad entry by user. Entire String is displayed in LCD. Alpha Key is pressed to toggle among numeric and various alphabets for a single key.

### Parameters

**line\_no** Description: line number to display edit keys on the LCD. Type: Input Range: 0 - 5

**start\_pos** Description: Specifies the column position to display or to take input. Type: Input Range: 0 - 20

**data** Description: Target buffer to be filled with edit keys data. Type: Input / Output Range: only 21 characters are visible if starts at 0

**max\_cnt** Description: Number of alphabets to be taken from the keypad. (maximum 21 alphabets are visible at once on display if starts at 0) Type: Input Range: 21 characters are visible (Limit depends on buffer size taken)

**count** Description: This field signifies the length of a non-null string in the buffer. In the case of a Null String it is zero. Both start\_pos and count act as a base and offset for the input from keypad. Type: Input Range: 0 - 20

**keytype** Description: edit key type (should be 0) Type: Input Range: 0 for shift key (Future expansion)

### Returns

Number of characters entered 0 pressed Enter key without data. -1 Cancel key Pressed. -2 if there is argument error.

#### 3.1.1.17 int lk\_getamount ( unsigned char line\_no, unsigned char start\_pos, unsigned char \* ptr, unsigned char max\_digits, unsigned char decimal\_pos )

This API function is used to get amount from user.

### Parameters

**line\_no** Description: line number to display on the LCD. Type: Input Range: 0 - 5

**start\_pos** Description: Specifies the column position to take input. Type: Input Range: 0 - 20

**ptr** Description: Target buffer to be filled with the amount. Type: Input Range: 21 characters ('\*') are visible (Limit depends on buffer size taken)

**max\_digits** Description: Maximum number of numeric characters to be taken from the keypad. 21 is the maximum numeric characters are visible at once on display if we selected Start position as 0. Type: Input Range: 21 characters ('\*') are visible (Limit depends on buffer size taken)

***decimal\_pos*** Description: Number of decimal positions required after decimal point + 1. Suppose we want 2 decimal positions we have give decimal position as 3. Range is 1 to 4 (we can obtain max 3 decimal positions). Type: Input Range: 1 - 4

#### Returns

Number of characters entered 0 pressed Enter key without data. -1 Cancel key Pressed. -2 if there is argument error

#### 3.1.1.18 int lk\_gethwid ( char \* hwid )

This API function is used to get the Hardware ID. (Pre Requirements: This id should be set at u-boot prompt before call this API like below VISIONTEK # setenv hwid 87654321 VISIONTEK # saveenv).

#### Parameters

***hwid*** Description: Read Hardware ID of 8 digits from u-boot environment variables. Type: Output Range: 8 digits (bytes)

#### Returns

0 on Success. -1 on Failure.

#### 3.1.1.19 unsigned char lk\_getkey ( void )

This API Function is used to get key that is pressed. It will wait until key is pressed and returns the key value.

#### Returns

Numeric keys or 255

#### 3.1.1.20 unsigned char lk\_getkey\_wait ( void )

This function returns key pressed at that particular instant, if there is no key event returns 0xff. This function is similar to lk\_getkey, only difference is it returns 0xff if there is no key pressed and it won't wait for a key.

#### Returns

Corresponding key value or 0xff.

#### 3.1.1.21 int lk\_getnumeric ( unsigned char line\_no, unsigned char start\_pos, unsigned char \* data, unsigned char max\_cnt, unsigned char count )

This API function is used to pass a buffer with a Null string or a non-null string and the subsequent Numeric characters are filled from keypad entry by user. Entire String is displayed in LCD.

#### Parameters

***line\_no*** Description: line number to display edit keys on the LCD. Type: Input Range: 0 - 5

**start\_pos** Description: Specifies the column position to display or to take input. Type: Input Range: 0 - 20

**data** Description: Target buffer to be filled with edit keys data. Type: Input / Output Range: only 21 characters are visible if starts at 0

**max\_cnt** Description: Number of numerics to be taken from the keypad (maximum 21 alphabets are visible at once on display if starts at 0) Type: Input Range: 21 characters are visible (Limit depends on buffer size taken)

**count** Description: This field signifies the length of a non-null string in the buffer. In the case of a Null String it is zero. Both start\_pos and count act as a base and offset for the input from keypad. Type: Input Range: 0 - 20

### Returns

Number of characters entered 0 pressed Enter key without data. -1 Cancel key Pressed. -2 if there is argument error.

NOTE: 21 character input not displayed no LCD.

#### 3.1.1.22 int lk\_getpassword ( unsigned char \* ptr, unsigned char line\_no, unsigned char max\_cnt )

This API Function is used to get the password from the keypad. Digits entered will be displayed as '\*' on the display and fills the target buffer with entered digits.

### Parameters

**ptr** Description: buffer to be filled with the password entered through keyboard. Type: Input Range: 21 characters ('\*'s) are visible (Limit depends on buffer size taken)

**line\_no** Description: line number to display on the LCD. Type: Input Range: 0 - 5

**max\_cnt** Description: Maximum Number of digits to be taken from the keypad. Type: Input Range: 21 characters ('\*'s) are visible (Limit depends on buffer size taken)

### Returns

Number of digits entered on Success. 0 if user pressed enter key without data. -1 if Cancel key is pressed. -2 on the argument errors.

#### 3.1.1.23 int lk\_getpinpadid ( char \* machineid )

This API function is used to get the PIN PAD ID. (Pre Requirements: This id should be set at u-boot prompt before call this API like below VISIONTEK # setenv machineid 1234567890 VISIONTEK # saveenv).

### Parameters

**machineid** Description: Read machine ID of 10 digits from u-boot environment variables. Type: Output Range: 10 digits (bytes)

### Returns

Return Values 0 on SUCCESS. -1 on Failure.

### 3.1.1.24 int lk\_gsm\_signal ( unsigned long *gsm\_signal* )

This function is to display signal strength of GSM modem which is connected to ttyMXC0. By giving 'at+csq' command to modem, we can get the GSM signal strength. By giving the GSM signal strength value to this function we can update the signal strength bars on top of the LCD.

#### Parameters

***gsm\_signal*** Description: GSM modem signal strength value. Type: Input Range: 0 - 31 (if wit at+csq receive 99 then pass 0 to show no signal on LCD) Greater than 31 or less than 1 - No bars Greater than 25 - 4bars Greater than 15 - 3bars Greater than 10 - 2bars Greater than 1 - 1bar

#### Returns

0 on Success. -1 on Failure.

### 3.1.1.25 int lk\_open ( void )

This API Function is used to open LCD and Keypad devices. Note: This function must be called before any LCD and Keypad functions.

#### Returns

0 on Success. -1 on failure.

### 3.1.1.26 int lk\_underline ( unsigned char *line\_no*, unsigned char *col*, unsigned char *length*, unsigned char *font\_width* )

This API Function underlines the text On LCD.

#### Parameters

***line\_no*** Description: line number to display the text on the LCD. Type: Input Range: 0 - 5

***col*** Description: Column number to starting underline. Type: Input Range: 0 -20

***length,;*** Description: Number of characters to underline. Type: Input Range: max 21 characters (depends on col)

***font\_width*** Description: Font width is 6. Type: Input Range: 6

#### Returns

0 on success. -1 on Error. -2 on Arguments Error.

## 3.2 RTC Module Header.

### Functions

- int [lk\\_getrtc](#) (struct tm \*)

*This API Function gets the time from the RTC chip or from the OS if already set.*

- int [lk\\_setrtc](#) (struct tm \*)

*This API function sets the time to the RTC chip as well as for OS.*

### 3.2.1 Function Documentation

#### 3.2.1.1 int lk\_getrtc ( struct tm \* )

This API Function gets the time from the RTC chip or from the OS if already set.

##### Parameters

- \* A pointer to tm structure. (time.h)The API call populates this structure

##### Returns

0 on success. -1 on failure.

#### 3.2.1.2 int lk\_setrtc ( struct tm \* )

This API function sets the time to the RTC chip as well as for OS.

##### Parameters

- \* A pointer to tm structure. The API call populates this structure.

##### Returns

0 on success. -1 on failure.

## 3.3 Printer Module Header.

### Functions

- int [prn\\_open](#) ()  
*This API Function is used to open the printer device . Note: This function must be called before any printer function.*
- int [prn\\_close](#) ()  
*This API Function is used to close the printer device .*
- int [prn\\_write\\_text](#) (unsigned char \*text2, int len, int font)  
*This API Function is used to prints the text .*
- int [prn\\_write\\_bmp](#) (unsigned char \*bitmap, long len)  
*This API Function is used to print bmp data .*
- int [prn\\_paper\\_feed](#) (int scanlines)  
*This API Function is used to advance the paper .*
- int [prn\\_paperstatus](#) (void)  
*This API Function is used printer papar status .*

### 3.3.1 Function Documentation

#### 3.3.1.1 `int prn_close ( )`

This API Function is used to close the printer device .

##### Returns

1 if the device closed successfully -1 if the device is not close.

#### 3.3.1.2 `int prn_open ( )`

This API Function is used to open the printer device . Note: This function must be called before any printer function.

##### Returns

1 on Success. 2 if the device is already opened -1 on failure.

#### 3.3.1.3 `int prn_paper_feed ( int scanlines )`

This API Function is used to advance the paper .

##### Parameters

*scanlines*,: Description: scanlines is to be passed as parameter (1 text line is equal to 17 scan lines).  
Type: INPUT

##### Returns

0 no. of characters written on success -1 if error occurs. -2 if the length is more . -3 NO Paper . -4 Low Battery. -5 Max temp . -6 No Lines. -7 WRITE\_ERROR.

#### 3.3.1.4 `int prn_paperstatus ( void )`

This API Function is used printer paper status .

##### Returns

0 on Success. 3 on Error.

#### 3.3.1.5 `int prn_write_bmp ( unsigned char * bitmap, long len )`

This API Function is used to print bmp data .

##### Parameters

*bitmap*,: Description: pointer to the buffer from which the data to be printed.the image is 384x480 pixels type: INPUT

*len*,: Description: length of the text. type: INPUT

**Returns**

0 no. of characters written on success -1 if error occurs. -2 if the length is more . -3 NO Paper . -4 Low Battery. -5 Max temp . -6 No Lines. -7 WRITE\_ERROR.

**3.3.1.6 int prn\_write\_text ( unsigned char \* text2, int len, int font )**

This API Function is used to prints the text .

**Parameters**

*text2*,: Description: pointer to the buffer from which the text to be printed. Type: INPUT

*len*,: Description: length of the text. Type: INPUT

*font*,: Description: font of the the text presently there are two fonts are supported.(1 and 2 fonts).  
Type: INPUT

**Returns**

0 on Success. -1 if the device not opened . -2 if the length is more . -3 NO Paper . -4 Low Battery. -5 Max temp . -6 No Lines. -7 WRITE\_ERROR.

**3.4 Barcode Module Header.****Functions**

- int [bar\\_code\\_open](#) (void)

*This API Function is used to open barcode device. Note: This function must be called before any barcode function.*

- int [bar\\_code\\_read](#) (unsigned char \*rxbuf, int len)

*This API Function reads the barcode.*

- int [bar\\_code\\_close](#) (void)

*This API Function closes the barcode.*

**3.4.1 Function Documentation****3.4.1.1 int bar\_code\_close ( void )**

This API Function closes the barcode.

**Returns**

0 on Success. -1 on Error.

### 3.4.1.2 int bar\_code\_open ( void )

This API Function is used to open barcode device. Note: This function must be called before any barcode function.

#### Returns

0 on Success. -1 on failure.

### 3.4.1.3 int bar\_code\_read ( unsigned char \* rxbuf, int len )

This API Function reads the barcode.

#### Parameters

**rxbuf,:** Description: buffer used to store barcode data. type: output Range: 0 - 256

**len,:** Description: len means size of data to be read (For future expansion. Now, it will return on enter)  
Returns data size read. type: input Range: 0 - 256

#### Returns

>0 on Success. -1 on Error.

## 3.5 RFID Module Header.

### Functions

- int [tama\\_open](#) (void)

*This API Function is used to open RFID device. Note: This function must be called before any rfid function.*

- void [tama\\_close](#) (void)

*This API Function is used to close rfid device. Note: This function must be called before any rfid function.*

- int [tama\\_detectTarget](#) (unsigned char Tg\_Nos, unsigned char \*Tg\_Detected, unsigned char \*Tg\_ID)

*This API Function is used to detect the targets of RFID Card reader.*

- int [tama\\_authenticate\\_mifare](#) (unsigned char Tg\_No, unsigned char Blk\_Addr, unsigned char index, unsigned char Key\_Type)

*This API Function authenticates a Tag's Block for writing/reading with the said key.*

- int [tama\\_authenticate\\_mifare\\_key](#) (unsigned char Tg\_No, unsigned char Blk\_Addr, unsigned char \*Key, unsigned char Key\_Type)

*This API Function authenticates a Tag's Block for writing/reading with the said key.*

- int [tama\\_halt\\_mifare](#) (unsigned char Tg\_LID)

*This API Function halts (Deselects) a tag for access.*

- int [tama\\_read\\_target](#) (unsigned char Blk\_Addr, unsigned char \*Data\_In)

*This API Function reads the block data and stores it into passed address.*

- `int tama_write_target` (unsigned char *Blk\_Addr*, unsigned char \**Data\_Out*, int *Dlen*)  
*This API Function writes the data sent to the said block.*
- `int tama_rffieldon` (void)  
*This API Function is used to power ON RF field. Note: This function must be called after tama\_open function.*
- `int tama_rffieldoff` (void)  
*This API Function is used to power OFF RF field. Note: This function must be called after tama\_open function.*

### 3.5.1 Function Documentation

#### 3.5.1.1 `int tama_authenticate_mifare ( unsigned char Tg_No, unsigned char Blk_Addr, unsigned char index, unsigned char Key_Type )`

This API Function authenticates a Tag's Block for writing/reading with the said key.

##### Parameters

***Tg\_No*** Description: Tag Number to authenticate(0 - Card 1, 1 - Card 2). Type: INPUT

***Blk\_Addr*** Description: Block address Type: INPUT

***index*** Description:key index Type: INPUT

***Key\_Type*** Description:Key Type (Key A - 0x0A /Key B - 0x0B) Type: INPUT

##### Returns

0 on success. < 1 on failure.

#### 3.5.1.2 `int tama_authenticate_mifare_key ( unsigned char Tg_No, unsigned char Blk_Addr, unsigned char * Key, unsigned char Key_Type )`

This API Function authenticates a Tag's Block for writing/reading with the said key.

##### Parameters

***Tg\_No*** Description: Tag Number to authenticate(1- Card 1, 2 - Card 2). Type: INPUT

***Blk\_Addr*** Description: Block address Type: INPUT

***\*Key*** Description:key Type: INPUT

***Key\_Type*** Description:Key type (Key A - 0x0A /Key B - 0x0B). Type: INPUT

##### Returns

0 on success. < 1 on failure.

#### 3.5.1.3 `void tama_close ( void )`

This API Function is used to close rfid device. Note: This function must be called before any rfid function.

#### 3.5.1.4 **int tama\_detectTarget ( unsigned char *Tg\_Nos*, unsigned char \* *Tg\_Detected*, unsigned char \* *Tg\_ID* )**

This API Function is used to detect the targets of RFID Card reader.

##### Parameters

*Tg\_Nos* Description: Number of targets to detect(Max. 2). Type: INPUT Range: Max. 2

*Tg\_Detected* Description:Address of memory to store number of Tags detected. Type: INPUT

*Tg\_ID,:* Description:Address of memory to store Tag ID. Type: INPUT

##### Returns

Number of Tags read/initialized is stored in the address passed to *Tg\_Detected*.The read Tag is stored in location pointed by Tag ID pointer. 0 on Success. -1 on Failure.

#### 3.5.1.5 **int tama\_halt\_mifare ( unsigned char *Tg\_LID* )**

This API Function halts (Deselects) a tag for access.

##### Parameters

*Tg\_LID* Description: Tag's logical ID. Type: INPUT

##### Returns

0 on success. < 1 on failure.

#### 3.5.1.6 **int tama\_open ( void )**

This API Function is used to open RFID device. Note: This function must be called before any rfid function.

##### Returns

0 opened file descriptor on success. < 1 on failure.

#### 3.5.1.7 **int tama\_read\_target ( unsigned char *Blk\_Addr*, unsigned char \* *Data\_In* )**

This API Function reads the block data and stores it into passed address.

##### Parameters

*Blk\_Addr* Description: Block address to read. Type: INPUT

*Data\_In* Description:pointer to the data in buffer. Type: INPUT

##### Returns

0 on success. < 1 on failure.

**3.5.1.8 int tama\_rffieldoff ( void )**

This API Function is used to power OFF RF field. Note: This function must be called after tama\_open function.

**Returns**

0 opened file descriptor on success. < 1 on failure.

**3.5.1.9 int tama\_rffieldon ( void )**

This API Function is used to power ON RF field. Note: This function must be called after tama\_open function.

**Returns**

0 opened file descriptor on success. < 1 on failure.

**3.5.1.10 int tama\_write\_target ( unsigned char *Blk\_Addr*, unsigned char \* *Data\_Out*, int *Dlen* )**

This API Function writes the data sent to the said block.

**Parameters**

***Blk\_Addr*** Description: Block address to write. Type: INPUT

***Data\_Out*** Description:pointer to the data . Type: INPUT

***Dlen*** Description:length of data to write . Type: INPUT

**Returns**

0 on success. < 1 on failure.

**3.6 Magswipe Device Module Header .****Functions**

- int [mscr\\_open](#) (void)

*This API Function is used to open magswipe device. Note: This function must be called before any magswipe function.*

- int [mscr\\_pwr\\_enable](#) (void)

*This API Function is used to power ON magswipe device.*

- int [mscr\\_pwr\\_disable](#) (void)

*This API Function is used to power OFF magswipe device.*

- int [mscr\\_read](#) (char \*track\_1\_data, char \*track\_2\_data, char \*track\_3\_data)

*This API function reads the data of the both tracks from the card reader .*

- int [mscr\\_flush](#) (void)

*This API Function clears the card reader device buffer returns SUCCESS on success, returns MAG\_SW\_ERR if the device not opened.*

- int `mscr_getstate` (void)

*This API Function is used to check whether the device is having valid data ( both track1 and track2 data).*

- int `mscr_close` (void)

*This API Function is to close magnetic swipe device.*

### 3.6.1 Function Documentation

#### 3.6.1.1 int `mscr_close` ( void )

This API Function is to close magnetic swipe device.

##### Returns

1 on Success. MAG\_SW\_ERR (-1) on failure.

#### 3.6.1.2 int `mscr_flush` ( void )

This API Function clears the card reader device buffer returns SUCCESS on success, returns MAG\_SW\_ERR if the device not opened.

##### Returns

1 on Success. MAG\_SW\_ERR (-1) on Failure

#### 3.6.1.3 int `mscr_getstate` ( void )

This API Function is used to check whether the device is having valid data ( both track1 and track2 data).

##### Returns

1 on Success. MAG\_SW\_ERR (-1) if there is no valid data.

#### 3.6.1.4 int `mscr_open` ( void )

This API Function is used to open magswipe device. Note: This function must be called before any magswipe function.

##### Returns

1 on Success. MAG\_SW\_ERR (-1) on Failure

**3.6.1.5 int mscr\_pwr\_disable ( void )**

This API Function is used to power OFF magswipe device.

**Returns**

1 on Success. -1 on Failure

**3.6.1.6 int mscr\_pwr\_enable ( void )**

This API Function is used to power ON magswipe device.

**Returns**

1 on Success. -1 on Failure

**3.6.1.7 int mscr\_read ( char \* track\_1\_data, char \* track\_2\_data, char \* track\_3\_data )**

This API function reads the data of the both tracks from the card reader .

**Parameters**

*track\_1\_data, track\_2\_data, track\_3\_data, :*

Description: Pointers to the buffers where tracks data to be copied are to be passed as arguments, track1 and track2 are character pointer data types and the memory allocated to them should be length of the expected data+1(suggested 256 bytes each) Type: input Range: 256 bytes

**Returns**

'1' if only track1 data is valid and copied data into track\_1\_data buffer '2' if only track2 data is valid and copied data into track\_2\_data buffer '3' if only track3 data is valid and copied data into track\_3\_data buffer '4' if track 1 & 2 are valid and copied data into track\_1\_data buffer & track\_2\_data buffer '5' if track 2 & 3 are valid and copied data into track\_2\_data buffer & track\_3\_data buffer '6' if track 1 & 3 are valid and copied data into track\_1\_data buffer & track\_3\_data buffer '7' if track 1, 2 & 3 are valid and copied into all three buffers, MAG\_SW\_ERR (-1) if there is no valid data of all three tracks or device not opened.

**3.7 SAM And IFD Module Header.****Functions**

- int [SAM\\_Open](#) (void)

*This function checks for the existence of the Sam card reader device and if found prepares it for further communication. Before attempting any operations related to Sam card reader device this function should be called.*

- int [SAM\\_Close](#) ()

*This function closes the SAM device. After finishing all the operations related to SAM card reader this function should get called.*

- int [SAM\\_GetAtr](#) (unsigned int \*length, unsigned char \*buffer)

*This API reads ATR from the card.*

- int [SAM\\_SendCommand](#) (unsigned char \*CAPDU\_Data, unsigned int CLen, unsigned char \*RAPDU\_Data, int \*RLen)

*This API is used to send all the EMV complaint CAPDUs to the card. The API call sends the command contained in CAPDU Data buffer and gives the response and \*its length out through RAPDU Data and RLen variables respectively.*

- int [SAM\\_ColdReset](#) (int selection)

*This API is to power up the card, after this call Vcc is applied as selected during card select API. After this call only we can do any command operations on \*n card.*

- int [SAM\\_Select\\_S1](#) (int volt)

*This API is to select the SAM slot one. And send return value to SAM\_ColdReset API.*

- int [SAM\\_Select\\_S2](#) (int volt)

*This API is to select the SAM slot two. And send return value to SAM\_ColdReset API.*

- int [SAM\\_Poweroff](#) (void)

*This API is used to Power off SAM module.*

### 3.7.1 Function Documentation

#### 3.7.1.1 int SAM\_Close ( )

This function closes the SAM device. After finishing all the operations related to SAM card reader this function should get called.

##### Returns

'0' on Success. '-1' on Error

#### 3.7.1.2 int SAM\_ColdReset ( int selection )

This API is to power up the card, after this call Vcc is applied as selected during card select API. After this call only we can do any command operations on \*n card.

##### Parameters

**selection** Description: 1- card1 5v 2- card1 3v 3- card1 1.8v 4- card2 5v 5- card2 3v 6- card3 1.8v  
type:input

##### Returns

'0' on Success '-1' on Failure

**3.7.1.3 int SAM\_GetAtr ( unsigned int \* *length*, unsigned char \* *buffer* )**

This API reads ATR from the card.

**Parameters**

*\*length*,: Description: length of ATR from card in bytes. type: output

*\*buffer* Description: pointer to buffer which holds ATR response from the card . type: output

**Returns**

'0' on Success '-1' on Error 'if unable to receive ATR this happens only if card is not present in slot'.

**3.7.1.4 int SAM\_Open ( void )**

This function checks for the existence of the Sam card reader device and if found prepares it for further communication. Before attempting any operations related to Sam card reader device this function should be called.

**Returns**

'0' on Success. '-1' on Error

**3.7.1.5 int SAM\_Poweroff ( void )**

This API is used to Power off SAM module.

**Returns**

-1 Failure 0 Success

**3.7.1.6 int SAM\_Select\_S1 ( int *volt* )**

This API is to select the SAM slot one. And send return value to SAM\_ColdReset API.

**Parameters**

*volt* Description: 1 - 5v 2 - 3v 3 - 1.8v

**Returns**

10 for 5v 11 for 3v 12 for 1.8v

**3.7.1.7 int SAM\_Select\_S2 ( int *volt* )**

This API is to select the SAM slot two. And send return value to SAM\_ColdReset API.

**Parameters**

*volt* Description: 1 - 5v 2 - 3v 3 - 1.8v

**Returns**

7 for 5v 8 for 3v 9 for 1.8v

### 3.7.1.8 int SAM\_SendCommand ( unsigned char \* CAPDU\_Data, unsigned int CLen, unsigned char \* RAPDU\_Data, int \* RLen )

This API is used to send all the EMV complaint CAPDUs to the card. The API call sends the command contained in CAPDU Data buffer and gives the response and \*its length out through RAPDU Data and RLen variables respectively.

#### Parameters

\*CAPDU\_Data Description:Buffer holding the command APDU in the standard format type:input

CLen Description:length of the CAPDU Data buffer type:input

\*RAPDU\_Data Description:Buffer to hold the response APDU in the standard format type:output

RLen Description:variable to hold response length. type:output

#### Returns

'0' on Success '-1' on Failure 'communication error occurred and the device is closed'.

## 3.8 USB-HOST Module Header.

### Functions

- int [usb\\_pwr\\_enable](#) (void)

*This API Function is used to power on usb-host device.*

- int [usb\\_pwr\\_disable](#) (void)

*This API Function is used to power off usb-host device.*

### 3.8.1 Function Documentation

#### 3.8.1.1 int usb\_pwr\_disable ( void )

This API Function is used to power off usb-host device.

#### Returns

0 on Success. -1 on failure.

#### 3.8.1.2 int usb\_pwr\_enable ( void )

This API Function is used to power on usb-host device.

#### Returns

0 on Success. -1 on failure.

## 3.9 Audio Module Header.

### Functions

- int `audio_pwr_enable` (void)  
*This API Function is used to power on audio device.*
- int `audio_pwr_disable` (void)  
*This API Function is used to power off audio device.*

### 3.9.1 Function Documentation

#### 3.9.1.1 int `audio_pwr_disable` ( void )

This API Function is used to power off audio device.

#### Returns

0 on Success. -1 on failure.

#### 3.9.1.2 int `audio_pwr_enable` ( void )

This API Function is used to power on audio device.

#### Returns

0 on Success. -1 on failure.

## 3.10 Wi-fi Module Header.

### Functions

- int `wifi_enable` (void)  
*This API Function is used to enable wifi functionality.*
- int `wifi_disable` (void)  
*This API function is used to disable wifi functionality.*
- int `wifi_rfpower_on` (void)  
*This API function is used to power on the RF section of wifi.*
- int `wifi_rfpower_off` (void)  
*This API function is used to power off the RF section of wifi.*

### 3.10.1 Detailed Description

\* \* \*

### 3.10.2 Function Documentation

#### 3.10.2.1 `int wifi_disable ( void )`

This API function is used to disable wifi functionality.

##### Returns

0 On Success. -1 On Failure.

#### 3.10.2.2 `int wifi_enable ( void )`

This API Function is used to enable wifi functionality.

##### Returns

0 on Success. -1 on failure.

#### 3.10.2.3 `int wifi_rfpower_off ( void )`

This API function is used to power off the RF section of wifi.

##### Returns

0 on Success. -1 on Failure.

#### 3.10.2.4 `int wifi_rfpower_on ( void )`

This API function is used to power on the RF section of wifi.

##### Returns

0 on Success. -1 on Failure. -2 on wifi is not enable.

# Chapter 4

## File Documentation

### 4.1 GL14pos.h File Reference

#### Functions

- int [lk\\_open](#) (void)  
*This API Function is used to open LCD and Keypad devices. Note: This function must be called before any LCD and Keypad functions.*
- void [lk\\_dispcclr](#) (void)  
*This API Function clears all pixels on LCD. Note: This function must be called explicitly after lk\_open to clear LCD.*
- void [lk\\_dispfill](#) (void)  
*This API Function fills all pixels on LCD.*
- int [lk\\_displineclr](#) (unsigned char line\_no)  
*This API Function Clears pixels of the Specified line on LCD.*
- int [lk\\_disptext](#) (unsigned char line\_no, unsigned char column, unsigned char \*data, unsigned char font)  
*This API Function displays the string of data at specified line and column in a given font.*
- void [lk\\_close](#) ()  
*This API Function is used to close device.*
- int [lk\\_dispbmp](#) (unsigned char xstartcord, unsigned char ystartcord, unsigned char xendcord, unsigned char yendcord, unsigned char \*bmp)  
*This API Function displays the BMP Image on LCD at user given coordinates. Windows tool provided to convert bmp to hex.*
- int [lk\\_dispbox](#) (unsigned char line\_no, unsigned char cmdnd)  
*This API Function Displays Box at Specified Line.*
- int [lk\\_getalpha](#) (unsigned char line\_no, unsigned char start\_pos, unsigned char \*data, unsigned char max\_cnt, unsigned char count, unsigned char keytype)

*This API function is used to pass a buffer with a Null string or a non-null string and the subsequent alpha numeric characters are filled from keypad entry by user. Entire String is displayed in LCD. Alpha Key is pressed to toggle among numeric and various alphabets for a single key.*

- int [lk\\_getnumeric](#) (unsigned char line\_no, unsigned char start\_pos, unsigned char \*data, unsigned char max\_cnt, unsigned char count)

*This API function is used to pass a buffer with a Null string or a non-null string and the subsequent Numeric characters are filled from keypad entry by user. Entire String is displayed in LCD.*

- int [lk\\_getpassword](#) (unsigned char \*ptr, unsigned char line\_no, unsigned char max\_cnt)

*This API Function is used to get the password from the keypad. Digits entered will be displayed as '\*' on the display and fills the target buffer with entered digits.*

- int [lk\\_getamount](#) (unsigned char line\_no, unsigned char start\_pos, unsigned char \*ptr, unsigned char max\_digits, unsigned char decimal\_pos)

*This API function is used to get amount from user.*

- int [lk\\_dispbbutton](#) (unsigned char \*button1, unsigned char \*button2, unsigned char \*button3, unsigned char \*button4)

*This API Function Display the Four Buttons at 5th line of LCD.*

- int [lk\\_disphlight](#) (unsigned char line\_no)

*This API function is used to highlight a given row of text on LCD.*

- int [lk\\_dispfont](#) (unsigned char \*user\_font, unsigned char font\_width)

*This API Function which type of Font to be Displayed on LCD.*

- int [lk\\_bkl\\_timeout](#) (int bkltime)

*This API function sets statically LCD backlight timeout. The default timeout is 4 sec. If you want the change the backlight timeout permanently you have to call this function once in your application.*

- int [lk\\_dispbklight](#) (int val)

*This API function shows lcd backlight intensity.*

- int [lk\\_dispkpbklight](#) (int val) int [lk\\_lcdintensity](#)(unsigned char value)

*This API function shows keypad backlight intensity.*

- int [lk\\_gsm signal](#) (unsigned long gsm\_signal)

*This function is to display signal strength of GSM modem which is connected to ttyMXC0. By giving 'at+csq' command to modem, we can get the GSM signal strength. By giving the GSM signal strength value to this function we can update the signal strength bars on top of the LCD.*

- unsigned char [lk\\_getkey](#) (void)

*This API Function is used to get key that is pressed. It will wait until key is pressed and returns the key value.*

- unsigned char [lk\\_getkey\\_wait](#) (void)

*This function returns key pressed at that particular instant, if there is no key event returns 0xff. This function is similar to lk\_getkey, only difference is it returns 0xff if there is no key pressed and it won't wait for a key.*

- int [lk\\_buzzer\\_time](#) ()

*This API Function gives buzzer Beep delay of 20ms time.*

- int [lk\\_buzzer](#) (int count)  
*This API Function gives buzzer Beep count time.*
- int [lk\\_underline](#) (unsigned char line\_no, unsigned char col, unsigned char length, unsigned char font\_width)  
*This API Function underlines the text On LCD.*
- int [lk\\_getpinpadid](#) (char \*machineid)  
*This API function is used to get the PIN PAD ID. (Pre Requirements: This id should be set at u-boot prompt before call this API like below VISIONTEK # setenv machineid 1234567890 VISIONTEK # saveenv).*
- int [lk\\_gethwid](#) (char \*hwid)  
*This API function is used to get the Hardware ID. (Pre Requirements: This id should be set at u-boot prompt before call this API like below VISIONTEK # setenv hwid 87654321 VISIONTEK # saveenv).*
- int [lk\\_getrtc](#) (struct tm \*)  
*This API Function gets the time from the RTC chip or from the OS if already set.*
- int [lk\\_setrtc](#) (struct tm \*)  
*This API function sets the time to the RTC chip as well as for OS.*
- int [prn\\_open](#) ()  
*This API Function is used to open the printer device . Note: This function must be called before any printer function.*
- int [prn\\_close](#) ()  
*This API Function is used to close the printer device .*
- int [prn\\_write\\_text](#) (unsigned char \*text2, int len, int font)  
*This API Function is used to prints the text .*
- int [prn\\_write\\_bmp](#) (unsigned char \*bitmap, long len)  
*This API Function is used to print bmp data .*
- int [prn\\_paper\\_feed](#) (int scanlines)  
*This API Function is used to advance the paper .*
- int [prn\\_paperstatus](#) (void)  
*This API Function is used printer papar status .*
- int [bar\\_code\\_open](#) (void)  
*This API Function is used to open barcode device. Note: This function must be called before any barcode function.*
- int [bar\\_code\\_read](#) (unsigned char \*rxbuf, int len)  
*This API Function reads the barcode.*
- int [bar\\_code\\_close](#) (void)  
*This API Function closes the barcode.*

- int [tama\\_open](#) (void)  
*This API Function is used to open RFID device. Note: This function must be called before any rfid function.*
- void [tama\\_close](#) (void)  
*This API Function is used to close rfid device. Note: This function must be called before any rfid function.*
- int [tama\\_detectTarget](#) (unsigned char Tg\_Nos, unsigned char \*Tg\_Detected, unsigned char \*Tg\_ID)  
*This API Function is used to detect the targets of RFID Card reader.*
- int [tama\\_authenticate\\_mifare](#) (unsigned char Tg\_No, unsigned char Blk\_Addr, unsigned char index, unsigned char Key\_Type)  
*This API Function authenticates a Tag's Block for writing/reading with the said key.*
- int [tama\\_authenticate\\_mifare\\_key](#) (unsigned char Tg\_No, unsigned char Blk\_Addr, unsigned char \*Key, unsigned char Key\_Type)  
*This API Function authenticates a Tag's Block for writing/reading with the said key.*
- int [tama\\_halt\\_mifare](#) (unsigned char Tg\_LID)  
*This API Function halts (Deselects) a tag for access.*
- int [tama\\_read\\_target](#) (unsigned char Blk\_Addr, unsigned char \*Data\_In)  
*This API Function reads the block data and stores it into passed address.*
- int [tama\\_write\\_target](#) (unsigned char Blk\_Addr, unsigned char \*Data\_Out, int Dlen)  
*This API Function writes the data sent to the said block.*
- int [tama\\_rffieldon](#) (void)  
*This API Function is used to power ON RF field. Note: This function must be called after tama\_open function.*
- int [tama\\_rffieldoff](#) (void)  
*This API Function is used to power OFF RF field. Note: This function must be called after tama\_open function.*
- int [mscr\\_open](#) (void)  
*This API Function is used to open magswipe device. Note: This function must be called before any magswipe function.*
- int [mscr\\_pwr\\_enable](#) (void)  
*This API Function is used to power ON magswipe device.*
- int [mscr\\_pwr\\_disable](#) (void)  
*This API Function is used to power OFF magswipe device.*
- int [mscr\\_read](#) (char \*track\_1\_data, char \*track\_2\_data, char \*track\_3\_data)  
*This API function reads the data of the both tracks from the card reader .*
- int [mscr\\_flush](#) (void)  
*This API Function clears the card reader device buffer returns SUCCESS on success, returns MAG\_SW\_ERR if the device not opened.*

- int [mscr\\_getstate](#) (void)  
*This API Function is used to check whether the device is having valid data ( both track1 and track2 data).*
- int [mscr\\_close](#) (void)  
*This API Function is to close magnetic swipe device.*
- int [SAM\\_Open](#) (void)  
*This function checks for the existence of the Sam card reader device and if found prepares it for further communication. Before attempting any operations related to Sam card reader device this function should be called.*
- int [SAM\\_Close](#) ()  
*This function closes the SAM device. After finishing all the operations related to SAM card reader this function should get called.*
- int [SAM\\_GetAtr](#) (unsigned int \*length, unsigned char \*buffer)  
*This API reads ATR from the card.*
- int [SAM\\_SendCommand](#) (unsigned char \*CAPDU\_Data, unsigned int CLen, unsigned char \*RAPDU\_Data, int \*RLen)  
*This API is used to send all the EMV compliant CAPDUs to the card. The API call sends the command contained in CAPDU Data buffer and gives the response and its length out through RAPDU Data and RLen variables respectively.*
- int [SAM\\_ColdReset](#) (int selection)  
*This API is to power up the card, after this call Vcc is applied as selected during card select API. After this call only we can do any command operations on card.*
- int [SAM\\_Select\\_S1](#) (int volt)  
*This API is to select the SAM slot one. And send return value to SAM\_ColdReset API.*
- int [SAM\\_Select\\_S2](#) (int volt)  
*This API is to select the SAM slot two. And send return value to SAM\_ColdReset API.*
- int [SAM\\_Poweroff](#) (void)  
*This API is used to Power off SAM module.*
- int [usb\\_pwr\\_enable](#) (void)  
*This API Function is used to power on usb-host device.*
- int [usb\\_pwr\\_disable](#) (void)  
*This API Function is used to power off usb-host device.*
- int [audio\\_pwr\\_enable](#) (void)  
*This API Function is used to power on audio device.*
- int [audio\\_pwr\\_disable](#) (void)  
*This API Function is used to power off audio device.*
- int [wifi\\_enable](#) (void)

*This API Function is used to enable wifi functionality.*

- int [wifi\\_disable](#) (void)

*This API function is used to disable wifi functionality.*

- int [wifi\\_rfpower\\_on](#) (void)

*This API function is used to power on the RF section of wifi.*

- int [wifi\\_rfpower\\_off](#) (void)

*This API function is used to power off the RF section of wifi.*

### 4.1.1 Detailed Description

GL14POS APIs and Definitions

Company Name: Linkwell Telesystems Pvt. Ltd ([visiontek.co.in](http://visiontek.co.in))

API Description: GL14POS LCD,KPD,RTC,Printer,Barcode,RFID,Magswipe,USB host,Audio,wi-Fi Device and SAM and IFD APIs.
